## Lesson 6-7 Assignment 2

For the number 2 problem. What I did after defining the constant values was to make a multidimensional array. It was easy setting up the values but the hard part for me was to add labels (A, B, C). The solution that I made was to add a printf statement before the array. As a result, I was not aligned properly with their values. For the vertical labels, I was not able to accomplish them since I find it hard to find a solution regarding them. In printing the values for the matrix/array, I do not know how to do it when letters are used, unless it is a number. The if-else statements were good but I am not sure if I put the correct charging station messages for point g and h since there are no test points for them. I just based the charging stations on the diagram provided.

My takeaway from this activity was to practice more on the multidimensional array, there are still certain parts that I find hard, but there are still some confusing parts for me. But all in all, I am still able to do it and I know that practice makes perfect. Soon enough I will be able to do and solve some problems and parts that did not work as intended. Because learning multidimensional arrays may seem easy but it will take some time to fully learn them and will be beneficial for me in the following times.
