Engelene Anuran

CMSC 21-1

1. The output for the program is: 1 2 4 8 16 32 64 128

```
Start here
       X as1.c X
        #include <stdio.h>
   1
   2
        int main(void)
      ₽ {
   3
         int i;
   5
         i = 1;
       printf("%d ", i);
   8
         i *= 2;
   9
  10
         return 0;
  11
  12
```

2. None. They all have the same outputs even though we've used the while, for, and do-while loop. This is because all of them are functionally equivalent as long as they will have the same body.

```
Start here X *as5.c X as2.c X as4.c X
           #include <stdio.h>
         int main (void) {
               int i,j,k;
               while (i < 10) {
               printf("%d \t", i);
               1++;
   10
              for(j=1; j < 10; j++) {
    printf("\n%d\n",j);
}</pre>
    11
   13
   14
   15
   16
    17
               k=1:
   18
                 printf("%d \t", k);
   20
               }while(k <10);
   21
   22
   23
24
            return 0;
```

3.

```
tarthere X = ass.c X ass.c X ass.c X ass.c X ass.c X ass.c X

int main(woid) // where program begins

int j; //declaring variable j as int
for(j=1; j <= 128;)( //setting the value of j to l and will continiously execute until the value of j is equal to less than or equal to 128
